DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless —(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

2. Claims 1-6, 10-11, are rejected under 35 U.S.C. 102(e) as being anticipated by Aldinger et al. (US 6,254,675 B1).

The applied reference has a common inventor (i.e. Fred Lange) with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this

Art Unit: 1765

application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

Aldinger et al. discloses the process of forming epitactic GaN layers on substrates by pyrolysis of spin coated GaN polymeric precursor layers using ammonia as a reactive gas, the precursors are converted into a crystalline GaN at temperatures of about 900°C (see col. 1 lines 25-40). The precursor is described as gallium carbodiimide in col. 1 lines 46-67. The suitable substrates are disclosed in col. 2 lines 20-37 as including single crystalline substrates such as α -Al₂O₃ (0001), α -Al₂O₃ (01-12), α -Al₂O₃ (11-20), α -Al₂O₃ (10-10), 6H-SiC (0001), GaAs (001), Si(001), and Si (111). The pyrolysis treatment of the precursor solution, which has been uniformly spun onto the substrate under a inert atmosphere, occurs under ammonia (a reduced form of nitrogen --a group V element) in a temperature of at least 600°C and preferably at about 900°C. (see col. 2 lines 38-65). In col. 4 lines 20-30 a "flushing with ammonia gas" occurs after the coating and before the heating.

Allowable Subject Matter

3. Claims 7-9, 12-30 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
